Intervention

Outcome measures

Primary outcome

Knowledge

Secondary outcome

Preferred and perceived participation.

Satisfaction/uncertainty.

Informed choice.

Decision control.

Study description

Background summary

During preoperative consultations not all aspects of the postoperative analgesia treatments are presented in detail and shared decision-making is not always applied. To improve informed participation of patients, a decision aid was developed concerning postoperative analgesia. The present study was primarily designed to evaluate the effectiveness of this decision aid in a randomized controlled trial on knowledge of participants.

Study objective

A decision aid about postoperative epidural analgesia will improve patients' knowledge.

Study design

Baseline (T1) directly before the preoperative consultation.

T2 directly after the consultation with the anaesthesiologist.

Intervention

Decision aid about postoperative analgesia

Eligibility criteria

Inclusion criteria

Adults.

Major thoracic or abdominal surgery.

Indication for epidural postoperative analgesia.

Exclusion criteria

Age < 18 years.

No indication for epidural postoperative analgesia.

Contraindication for epidural analgesia.

Study design

Design

Study type:	Interventional
Intervention model:	Parallel
Allocation:	Randomized controlled trial

Masking:	Single blinded (masking used)
Control:	N/A , unknown

Recruitment

NL	
Recruitment status:	Pending
Start date (anticipated):	01-06-2016
Enrollment:	300
Type:	Anticipated

Ethics review

Not applicable	
Application type:	Not applicable
