## Study description

### Study objective

The aim of the current study is to investigate and compare the actual risk of aggression and the assumed risk of aggression (by staff) in the forensic psychiatric and regular psychiatric population. The hypothesis is that the actual risk of aggression in the forensic psychiatric population is greater than the actual risk of aggression in the regular psychiatric population. Regarding assumed risk of aggression, the hypothesis is that the forensic staff is adequate in assessment of risks in the population they are working with and the regular psychiatric staff will estimate a lower risk of aggression of their own population compared to the forensic psychiatric population.

### Study design

One moment:

HCR-20 Version 3 (actual risk of aggression)

Scale of estimated problems by staff (assumed risk of aggression)

### Intervention

Actual Risk of aggression: HCR-20 version 3

Assumed Risk of aggression: Scale of Estimated Problems (custom made)
