## Summary

### ID

NL-OMON23935

### Source

NTR

### Brief title

N/A

## Sponsors and support

**Primary sponsor:** Department of Reproductive Medicine, University Medical Center, Utrecht, The Netherlands.

**Source(s) of monetary or material Support:** ZonMw

## Intervention

## Outcome measures

### Primary outcome

The primary outcome parameters chosen for this study were:

1. Pregnancy within one year of treatment after randomization leading to term (≥ 37 weeks gestation) live birth;
2. Total costs per couple and child up to 6 weeks after expected delivery, and (3) patient discomfort/distress during IVF treatment.

### Secondary outcome

N/A

## Study description

### Background summary

N/A

### Study objective

Strategies involving shorter and milder ovarian stimulation protocols and single embryo transfer may allow for more IVF cycles in the same period of time, resulting in similar term live birth rate per treatment period despite a minor reduction in birth rate per treatment cycle.

### Study design

N/A

### Intervention

IVF treatment.

## Eligibility criteria

## Inclusion criteria

Patients with an indication for IVF or IVF/ Intracytoplasmic Sperm Injection (ICSI) based on tubal, male or unexplained infertility were recruited. Patients under < 38 years with a normal menstrual cycle (cycle length between period 25-35 days) and without severe obesity or underweight (body mass index (BMI) 18-28 kg/m<sup>2</sup>) were eligible for the study.

## Exclusion criteria

N/A

## Study design

### Design

Study type:	Interventional
Intervention model:	Parallel
Allocation:	Randomized controlled trial
Masking:	Open (masking not used)
Control:	Active

### Recruitment

NL	
Recruitment status:	Recruitment stopped
Start date (anticipated):	01-02-2002
Enrollment:	400
Type:	Actual

## Ethics review

Positive opinion	
Date:	27-02-2006
Application type:	First submission

## Study registrations
