Intervention

Outcome measures

Primary outcome

Health literacy in patients considering oncology trial participation

Secondary outcome

Influence of health literacy on compliance

Study description

Background summary

The aim of this study is to gain insight into the health literacy (HL) of patients participating in early clinical trials in oncology (ECTs) in relation to protocol deviations (PDs) occurring during the first treatment cycle. HL is measured by the tool: Newest Vital Sign-Dutch (NVS-D), prior to study start. The NVS-D is a six-question tool to assess an individual's ability to find and interpret information (both text and numerical information) on an ice cream nutrition label. The number of correctly answered questions provides an indication about the level of HL. During the first cycle of study participation PDs related to patient issues are scored. PDs of interest are defined as: lack of compliance, missed scheduled visit and incorrect use of a diary or questionnaire. We correlated the occurrence of the PDs to HL.

Eligibility criteria

Inclusion criteria

- Patients >18 years
- Patients with a end stage of cancer in good condition who consider oncology clinical trials participation

Exclusion criteria

- Patients with a primairy braintumor or sympotomatic brainmetastases
- not fluent in Dutch

Study design

Design

Study type:	Observational non invasive
Intervention model:	Other
Masking:	Open (masking not used)
Control:	N/A , unknown

Recruitment

NL	
Recruitment status:	Recruiting
Start date (anticipated):	01-12-2015
Enrollment:	0
Type:	Anticipated

Ethics review

Positive opinion

Date: 06-04-2016
Application type: First submission
