Brief title

COVID-19 selftest distribution at food banks - study 2

Health condition

Covid-19

Sponsors and support

Primary sponsor: Dutch Ministry of Health, Welfare and Sport

Source(s) of monetary or material Support: Dutch Ministry of Health, Welfare and Sport

Intervention

Outcome measures

Primary outcome

Whether customers use a self-test as prevention before their visit to the food bank location.

Secondary outcome

Whether customers use a self-test as prevention in other situations.

Whether customers use a self-test in situations where a PCR test is required.

Study description

Background summary

As described in the previously submitted registration, data obtained in phase 1 of the study program have been used to develop an intervention aimed at promoting (correct) use of covid-19 selftests. In this study, the intervention will be tested. It involves the presentation of social norm and action planning components via posters shown at food banks. The intervention will

be presented at half (3) of the participating food banks, while the other half (3; matched for clientele characteristics) will serve as control locations. The intervention only consists of the passive presentation of this poster, no other aspects are involved. The posters will be shown during collection days in week 1 of the study; surveys to assess self-test use will be administered in the next week during collection days. The surveys will be administered orally and clientele is free to decide whether they want to participate or not. They are also debriefed about the presence (or not) of the posters.

Study objective

Customers of the experimental food banks (poster) use selftests more often as prevention than customers of the control food banks (no poster).

Study design

1 questionnaire after provision of COVID-19 self-tests via Dutch food banks

Intervention

A poster that involves the presentation of social norm and action planning components, shown at experimental food bank locations.
