Brief title

embryo transfer device

Health condition

electric device
embryo transfer
IVF

Sponsors and support

Primary sponsor: none

Source(s) of monetary or material Support: Vu medical center

Intervention

Outcome measures

Primary outcome

Position of embryos.

Secondary outcome

Pregnancy rates.

Study description

Background summary

The embryo transfer is the final moment in IVF treatment that can be influenced by the physician. It has been shown that the position of the transferred embryos does influence pregnancy rates. We hypothesize that the electric device offers a more precise method of embryo transfer, leading to exact positioning of the embryos and thus to higher pregnancy rates.

Study objective

We hypothesize that the electric device offers a more standardized way of embryo transfer, resulting in higher pregnancy rates.

Study design

N/A

Intervention

Electric device vs syringe.

Eligibility criteria

Inclusion criteria

All patients undergoing embryo transfer in the Vu Medical center.

Exclusion criteria

N/A

Study design

Design

Study type:	Interventional
Intervention model:	Crossover
Allocation:	Randomized controlled trial
Masking:	Open (masking not used)
Control:	N/A , unknown

Recruitment

NL	
Recruitment status:	Recruitment stopped
Start date (anticipated):	01-01-2009
Enrollment:	1216
Type:	Actual

Ethics review

Positive opinion

Date: 22-01-2009
Application type: First submission
