Intervention

Outcome measures

Primary outcome

Carer: Self Rated Burden Scale- VAS, CarerQol-7D; CarerQol-VAS

Person with dementia: Neuro Psychiatric Inventory

Secondary outcome

Carer: experienced health (RAND 36/SF36);

use of facilities and health care,

quality of life (EQ5D), use of psychotropic drugs, depression: Center for Epidemiologic Studies- Depression (CES-D) and anxiety: Hospital Anxiety and Depression Scale, anxiety subscale (HADS-A).

Person with dementia:

Katz index of independence basic activities of daily living (ADL), instrumental activities of daily living (IADL); Dementia Quality of life instrument DQI, use of facilities and health care; agitation: Cohen-Mansfield Agitation Inventory- Community: (CMAI-C); severity of dementia: Geriatric Deterioration Scale (GDS-Reisberg); use of psychotropic drugs

Study description

Study objective

Is an intensive multimodel multicomponent program for caregivers of people with dementia more effective than care as usual for the well being of the carer and the person with dementia

Study design

base line; 3 months; 6 months

Intervention

7- day residential intensive training of carers of people with dementia. The training is an intensive multi-component and multi-model training comprising psycho-social and psycho educational interventions and training of practical skills. Parallel to this training their partners with dementia receive an own program with therapeutic components and pleasant activities.

The control group will receive care as usual.
