Intervention

Outcome measures

Primary outcome

Determinants of the ICM that explain dietary adherence after gastric banding.

Secondary outcome

Which determinants (ICM) that predict a successful outcome for dietary adherence.

Study description

Background summary

The current study uses a quantitative and cross-sectional design, due to the fact that a questionnaire is used at one point in time, no control group is used and no experimental manipulation takes place. Behavioral determinants are researched, involved in dietary adherence to create insight in dietary adherence behavior after gastric banding. Determinants are chosen with guidance of the I Change Model. The locus of control is measured not guided by the ICM.

Study objective

Better insight in the behavior of gastric banding surgery patients with use of determinants of the I Change Model (ICM), (knowledge, risk perception, attitude, social support, self-efficacy, intention and personality traits). Furthermore the determinant locus of control is measured for explaining dietary adherence. All determinants are measured with a single questionnaire at one timepoint.

Eligibility criteria

Inclusion criteria

Current post-operative care at Atrium MC.

Exclusion criteria

1. Not receiving post-operative care at the Atrium MC;
2. Not having a gastric band.

Study design

Design

Study type:	Observational non invasive
Intervention model:	Parallel
Allocation:	Non controlled trial
Control:	N/A , unknown

Recruitment

NL	
Recruitment status:	Pending
Start date (anticipated):	16-05-2012
Enrollment:	220
Type:	Anticipated

Ethics review

Positive opinion	
Date:	05-06-2012
Application type:	First submission
