Intervention

Outcome measures

Primary outcome

Pain Sensitivity Questionnaire Score (PSQ)

Secondary outcome

Influence of gender and hormones on the PSQ

Prevalence of acute and chronic pain, intensity of pain, influence on quality of life

Study description

Background summary

Chronic pain affects 20% of the European population. Treatment still needs improvement while research is mostly focused on men. There are indications that male and female differ in pain sensitivity and experience. Known is the influence of motion pictures on emotions. The extent of influence on pain sensitivity is unknown. Purpose of this research was collecting data in the Dutch population on factors that could influence the pain sensitivity.

Study objective

Gender influences pain sensitivity

Painfull and happy themed motion pictures have an influence on pain sensitivity

Study design

N/A

Intervention

Motion pictures; none vs happy vs painfull vs neutral
