Brief title
Denosumab 20050244

Condition

- Bone disorders (excl congenital and fractures)
- Miscellaneous and site unspecified neoplasms benign

Synonym

Bone Metastases in Subjects with Advanced Cancer (Excluding Breast and Prostate Cancer) and Multiple Myeloma. Cancer (Except Breast and Prostate Cancer) spread to bone and Kahler's disease.

Research involving
Human

Sponsors and support

Primary sponsor: Amgen Inc.
Source(s) of monetary or material Support: Sponsor: Amgen Inc.;Thousand Oaks;California;U.S.A.

Intervention

Keyword: Advanced Cancer, Bone Metastases, Denosumab, Zoledronic Acid

Outcome measures

Primary outcome

Time to the first on-study SRE (non-inferiority)

Secondary outcome

Secondary Efficacy Endpoints

- time to the first on-study SRE (superiority)

- time to the first-and-subsequent on-study SRE (superiority, using multiple

event analysis)

Safety Endpoints

- subject incidence of treatment-emergent adverse events

- changes in laboratory values

- Incidence of anti-denosumab antibody (binding and neutralizing) formation

Study description

Background summary

Besides systemic antineoplastic treatment, radiation therapy to bone has been the mainstay of controlling metastatic bone disease. Other widely used palliative treatments of metastatic bone disease are bisphosphonates, which have been shown to reduce the incidence of SREs, bone pain, and hypercalcemia in patients with bone metastasis in several randomized clinical trials. While they have proven to be good inhibitors of bone resorption, it has become clear that their anti-resorptive activity resides in their ability to inhibit osteoclast activities, rather than their physicochemical properties. There is previous clinical experience with Denosumab in the treatment of prevention osteoporosis, and cancer associated bone diseases.

Study objective

To determine if denosumab is non-inferior to zoledronic acid with respect to the first on-study occurrence of a skeletal related event (SRE) in subjects with advanced cancers and bone metastases (or lytic bone lesions from multiple myeloma).

SRE is defined as pathologic fracture, radiation therapy to bone, surgery to bone, or spinal cord compression.

Study design

This is an international, phase 3, randomized, double-blind, active controlled study comparing denosumab with zoledronic acid in the treatment of bone metastases in subjects with advanced cancer or multiple myeloma. Approximately 1690 subjects will be randomized in a 1:1 ratio to receive either denosumab, administered at a dose of 120 mg SC every 4 weeks (Q4W), or zoledronic acid, administered IV at a dose of 4 mg (equivalent creatinine clearance-adjusted dose in subjects with baseline creatinine clearance * 60 mL/min) as a single, minimum 15-minute infusion Q4W, in a blinded manner. Each subject will receive either an SC injection of denosumab and an IV infusion of zoledronic acid placebo Q4W, or an SC injection of denosumab placebo and an IV infusion of zoledronic acid Q4W until approximately 745 subjects have experienced an on-study SRE. SRE is defined as pathologic fracture, radiation therapy to bone, surgery to bone, or spinal cord compression.
It is strongly recommended that all subjects receive daily supplements of at least 500 mg calcium and at least 400 IU of vitamin D, unless hypercalcemia is documented .

Intervention

IV injections (Zometa or placebo): every 4 weeks, SC injections (Denosumab or placebo): every 4 weeks, Total skeletal X-rays: every 12 weeks, Blood sampling

at screening and every 4 weeks. See also protocol version 07 March 2006 p. 74.

Study burden and risks

There could be allergic reactions to the s.c injections and iv administering of the medication.
The blood sampling can cause bruising and pain.

Known adverse events of denosumab are temporary decrease in blood calcium levels with symptoms of tingling sensation or muscle cramping.
Fatigue, muscle stiffness, weakness, bone pain constipation, upper respiratory inflammation or pain, diarrhea, abnormal touch sensation or itching or redness of the skin.
Infrequently development of antibodies to denosumab has occured.

Zoledronic acid: Adverse events reported by patients using intravenous bisphosphonates include (but are not limited to) the following: fever, nausea, constipation, diarrhea, vomiting, abdominal pain, bone and muscle pain, anemia (low red blood cell counts), fatigue, cough, difficulty breathing, weakness, and swelling of lower limbs.
Damage to the jaw bone (also called osteonecrosis of the jaw or ONJ) has been reported in patients with cancer receiving treatment regimens that include bisphosphonates.

The benefit for subjects is that all will be treated by an active drug shown to be effective in regards to delaying or preventing SRE occurance .

Eligibility criteria

Age
Adults (18-64 years)
Elderly (65 years and older)

Inclusion criteria

- adult with histologically or cytologically confirmed advanced cancers including solid tumors, multiple myeloma, and lymphoma ;- current or prior radiographic (ie, x-ray, computer tomography [CT], or magnetic resonance imaging [MRI]) evidence of at least 1 bone metastasis (or lytic bone lesion from multiple myeloma);- Eastern Cooperative Oncology Group (ECOG) performance status of 0, 1, or 2;- adequate organ function as defined by the following criteria:
* serum aspartate aminotransferase (AST) * 5 x upper limit of normal (ULN)
* serum alanine aminotransferase (ALT) * 5 x ULN
* serum total bilirubin * 2 x ULN
* creatinine clearance (Cockroft-Gault) * 30 mL/min
* albumin-adjusted serum calcium * 2.0 mmol/L (8.0 mg/dL) and * 2.9 mmol/L (11.5 mg/dL). ;- Before any study-specific procedure is performed, the appropriate written informed consent must be obtained.

Exclusion criteria

- diagnosis of breast or prostate cancer.
- current or prior IV bisphosphonate administration.
- current or prior oral bisphosphonate for the treatment of bone metastasis / osteolytic lesion.
- planned radiation therapy or surgery to bone.
- prior administration of denosumab.
- known brain metastases.
- life expectancy less than 6 months.
- prior history or current evidence of osteonecrosis/osteomyelitis of the jaw.
- active dental or jaw condition which requires oral surgery.
- non-healed dental/oral surgery.
- planned invasive dental procedure over the course of the study.

- evidence of any of the following conditions per subject self report or medical chart review:
* any other prior malignancy (other than basal cell carcinoma, or in situ cervical cancer) with active disease within 3 years before randomization
* known infection with human immunodeficiency virus
* active infection with Hepatitis B or Hepatitis C virus
- any organic or psychiatric disorder that, in the opinion of the investigator, might prevent the subject from completing the study or interfere with the interpretation of the study results.
- thirty days or less since receiving an investigational product or device (ie, does not have marketing authorization; thalidomide use is allowed) in another clinical trial.
- pregnant or breast-feeding women.
- subject with reproductive potential who will not agree to use effective contraception (as defined by the principal investigator or designee).
- known sensitivity to any of the products to be administered during the study (eg, zoledronic acid, mammalian derived products, calcium or vitamin D).
