Outcome measures

Primary outcome

Quality of life of the child after the wish fulfillment.

Secondary outcome

Coping of parents and child

Study description

Background summary

This project is aimed at investigating the effect of wish fulfillment of children with a serious illness, by the Doe Een Wens Stichting, which is The Make-A-Wish Foundation® of the Netherlands, affiliated to The Make-A-Wish Foundation® International. This foundation receives requests from sick children who would like to see their biggest wish become reality. Anecdotal evidence, from children and parents, suggests that the effect of the wish fulfillment goes beyond the particular event. Reactions from children and parents indicate that it may have an effect on the general quality of life of the child, and the course of the illness, that it may influence the way the family deals with the illness, and may have a long-term effect because of the strength of the memories of the event.

Study objective

The aim of the study is to assess the enduring effect of the wish fulfillment on the quality of life of children and parents.

Study design

A group of parents will be interviewed.

Study burden and risks

Participation in the study may be considered as a burden since the subject matter may potentially be upsetting. However, experiences of bereaved parents have recently been studied and research has shown that while parents may find talking about their child's death upsetting, since the subject is naturally upsetting, the interview experience in itself is not viewed as stressful; rather parents evaluate the experience of participating in research as positive and even useful (see protocol).
