### Intervention

Keyword: Effectiveness, Malnutrition, Nutritional intervention, Primary Care

#### **Outcome measures**

#### **Primary outcome**

Primary outcomes are weight and utility.

#### Secondary outcome

Secundary outcomes are arm circumference, fatfree mass, hand grip strength,

quality of life, physical functioning, physical activity, suppletion of vitamin

D and calcium and kneeheight.

# **Study description**

#### **Background summary**

Malnutrition is an extensive problem in Dutch health care; it lead to high costs of care and higher mortality. Often, malnutrition is not early recognized and treated. In primary care and home care is less attention for screening and treatment of malnutrition.

#### **Study objective**

To determine the effectiveness and efficiency of treatment for malnutrition in people aged 60 years and older after screening in primary care.

#### Study design

Randomized Controlled Trial

#### Intervention

2 - effectiveness and efficiency of treatment for malnutrition after screening in pr ... 10-05-2025

The interventiongroup will have a nutritional intervention and will be compared to the controlgroep. Both groeps will prescribed a vitamin D and calcium supplement.

#### Study burden and risks

not applicable
