1 - Neural networks underlying emotion word processing in autism and psychopathy: an ... 25-05-2025

Intervention

Keyword: ASD, emotion, language, psychopathy

Outcome measures

Primary outcome

1) Performance on reward/punishment learning task and ToM tests; 2) Emotional

valence ratings of words; 3) fMRI data obtained during passive reading of

neutral and emotional words and active emotional valence judgment

Secondary outcome

n/a

Study description

Background summary

Despite being different disorders, autism and psychopathy are both characterized by impairments related to empathy and emotion understanding. Studies suggest that attention and memory for emotional stimuli may be impaired in both groups as well. A model proposed by Blair suggests that different functions of the amygdala are impaired to a different degree in autism and psychopathy. However, no study to date directly compared processing of emotional stimuli in those two groups.

Study objective

The primary objectives of this study are: 1) to determine brain areas that are differentially involved in the processing of emotional words in the three groups: ASD, psychopathy and a matched group of healthy controls; 2) to determine whether performance on Theory of Mind tests and reward/punishment learning reliably dissociates the three groups;

Study design

This is a case-control study. In the first part of the study, the participants perform two Theory of Mind (ToM) skill tests and a reward/punishment learning task. In the second part, participants read neutral and emotional words

presented visually on the screen while lying in a MRI scanner.

Study burden and risks

The study does not involve invasive measures. The first part consists of a number of behavioral tests that last for about 3 hours (including 1.5 hours for the IQ testing) and is not associated with any risks or side effects. The second part consists of the session in the MRI scanner and lasts for about 1 hour. The Donders Institute has a lot of experience with very similar studies. The risks associated with the study procedures are negligible and the burden is minimal. There is no therapeutic benefit associated with the study.

Eligibility criteria

Age

Adults (18-64 years) Elderly (65 years and older)

Inclusion criteria

- 1) Age is between 18 and 50 years
- 2) Dutch is a native language
- 3) Vision is normal or corrected to normal
- 4) IQ is 80 or higher
- 5) male gender
- 6) a formal diagnosis of ASD (for ASD group), psychopathy (for psychopathy group), absence
- of any known neurological or psychiatric disorder (for healthy control group)

Exclusion criteria

- 1) history of brain surgery or brain trauma
- 2) neurological disorders such as epilepsy
- 3) use of antipsychotic medication
- 4) metal in the body
