Periventricular white matter lesions in small vessel disease related cognitive decline

Published: 15-07-2009 Last updated: 06-05-2024

1) to investigate cognitive functioning in lacunar infarct patients with and without periventricular white matter lesions; 2) to identify predictors for cognitive dysfunction in lacunar infarct patients.

Ethical review	Approved WMO
Status	Recruitment stopped
Health condition type	Central nervous system vascular disorders
Study type	Observational non invasive

Summary

ID

NL-OMON39446

Brief title Small vessel disease and cognitive function

Condition

- Central nervous system vascular disorders
- Cognitive and attention disorders and disturbances
- Vascular injuries

Synonym lacunar infarct, silent lesions

Research involving

Human

Sponsors and support

Primary sponsor: Medisch Universitair Ziekenhuis Maastricht

1 - Periventricular white matter lesions in small vessel disease related cognitive d \ldots 25-05-2025

Source(s) of monetary or material Support: Weijerhorst

Intervention

Keyword: cognitive functioning, small vessel disease, white matter lesions

Outcome measures

Primary outcome

Cognitive function based on several (neuro)psychological domains: information

processing speed, attention/concentration, executive functioning, memory and

language. Raw test scores will be used for analyses.

Presence/ progression WMLs.

Secondary outcome

Brain Microbleeds.

Other cerebral abnormalities observed by MRI: atrophy and other cerebral

abnormalities.

Study description

Background summary

Rationale: around a quarter of the yearly 24 to 25 thousand new patients with a brain infarct suffers from a so-called lacunar stroke: a small, deeply located brain infarct caused by a local abnormality in the small arteries (cerebral small vessel disease, SVD). Previous research found cognitive impairment in these patients. However, the exact cause of this SVD-mediated cognitive decline is not clear. Also, factors influencing and predicting the course of cognitive functioning have not yet been identified. Recent studies suggest that endothelial dysfunction may play a role.

Study objective

 to investigate cognitive functioning in lacunar infarct patients with and without periventricular white matter lesions;
to identify predictors for cognitive dysfunction in lacunar infarct

2 - Periventricular white matter lesions in small vessel disease related cognitive d ... 25-05-2025

patients.

Study design

Prospective, observational, follow-up cohort study.

Study burden and risks

Patients undergo non-invasive magnetic resonance imaging (MRI) of the brain and a neuropsychological assessment.

Eligibility criteria

Age

Adults (18-64 years) Elderly (65 years and older)

Inclusion criteria

- First lacunar infarct, diagnosed clinically as well as radiologically.
- Age of 18 years and older.

Exclusion criteria

- Brain infarct or other cerebral pathology in recent history.
- Potential source of cardio-embolism or carotic stenosis (large vessel disease)
- Severe comorbidity (specified as not being able to perform Activities of Daily Living (ADL independently)), including dementia.
- Limited life-expectancy
- History of inflammatory disease
- Contra indications for MRI
- o Heart valve prosthesis
- o Pacemaker
- o Intracerebral clips (aneurysm)
- o Intra-ocular metal pieces
- o Cochlear implant
- o Claustrophobia

- When the patient does not appreciate to receive the results of the study, in particular if abnormalities are found during MRI or neuropsychological assessment, which are of great importance for the patients health.
