Dapagliflozin on cholesterol metabolism in DM2: dissecting its effect on dyslipidemia by using stable isotope based cholesterol and glucose fluxes

Published: 07-04-2016 Last updated: 20-04-2024

to investigate the effect of 5 weeks dapagliflozin 1dd 10mg treatment on glucose and cholesterol fluxes in patients with type 2 diabetes on stable rosuvastatin treatment.

Ethical review	Approved WMO
Status	Recruitment stopped
Health condition type	Glucose metabolism disorders (incl diabetes mellitus)
Study type	Interventional

1 - Dapagliflozin on cholesterol metabolism in DM2: dissecting its effect on dyslipi ... 27-05-2025

Intervention

Keyword: cholesterol flux, dyslipidemia, glucose flux, type 2 diabetes

Outcome measures

Primary outcome

effect of 5 weeks dapagliflozin 10mg on top of rosuvastatin treatment on LDL de novo lipogenesis compared to rosuvastatin 10mg therapy only or no medication

Secondary outcome

Effect of 5 weeks dapagliflozin 10mg on:

-Change in VLDL secretion and clearance (as determined by 2H3 Leucine

enrichment) and relation to plasma CETP, PLTP and HDL subfractions

- (dietary) Triglyceride fluxes (as determined by 1,2,3,4-13C16 * palmitate

to measure FFA remnant uptake).

- hepatic and peripheral insulin sensitivity (2 step Hyperinsulinemic

normoglycemic clamp with 2H2enriched glucose:) and energy expenditure

including carbohydrate oxidation and fatty acid oxidation rates in breathing air

- liver fat content (MRI liver)

-change in fecal microbiome composition

-cholesterol and bile salt excretion

Study description

Background summary

Type 2 diabetes is associated with increased cardiovascular risk which is driven by hyperglycemia en dyslipidemia. A few years ago, a new glucose lowering medication of the SGLT2 inhibitors class (Dapagliflozin).was registered in the Netherlands. Dapagliflozin has been tested in relatively

2 - Dapagliflozin on cholesterol metabolism in DM2: dissecting its effect on dyslipi ... 27-05-2025

large studies and was effective in reducing HbA1c levels; however, a sideeffect of all SGLT2 inhibitors is the increase in plasma cholesterol (LDL, HDL and triglyceriden) with 5-8%. We would like to investigate what is mechanism is driving the increased plasma cholesterol (hepatic cholesterol synthesis, increased (dietary) intestinal cholesterol uptake in de darm or decreased excretion of cholesterol) and moreover whether this dyslipidemia might reduce the beneficial cardiovascular effects of glucose lowering by dapagliflozin.

Study objective

to investigate the effect of 5 weeks dapagliflozin 1dd 10mg treatment on glucose and cholesterol fluxes in patients with type 2 diabetes on stable rosuvastatin treatment.

Study design

open label single arm intervention study

Intervention

dapagliflozin 10mg once daily for 5 weeks and rosuvastatin 10mg 1dd during 9 weeks

Study burden and risks

Patients will bring 5 visits to the AMC (total 46 hours) during 13 weken; in total 470 ml blood is drawn. Infusion of stable isotopes, liver MRI and hyperinsulinemic clamp procedures are a safe and standard procedure at our department (METC 2013_071) and are not associated with increased risk. Rosuvastatin and dapagliflozin have been registered in the Nederlands and are frequently used in patients with type 2 diabetes and their use is not associated with increased risks. In conclusion, this is a low-moderate risk study and we feel that the burden of the study and its potential risks do not outweigh the benefits of increased pathophysiological insight into the drivers of dyslipidemia upon SGLT2 use in patients with type 2 diabetes mellitus.

Eligibility criteria

Age

Adults (18-64 years) Elderly (65 years and older)

Inclusion criteria

-Male or postmenopauzal female patients with type 2 diabetes mellitus(HbA1C *6.5% -<8.5%) -At least 12 weeks of stable dose metformin treatment, FPG<13.2 mmol/l -LDL cholesterol >2.5 mmol/l -Willing to switch used statin to rosuvastatin 10mg once daily for 9 weeks -18-75 years of age -Ability to provide informed consent

Exclusion criteria

-History of cardiovascular event
-Smoking
-exogenous insulin use
-Creatinin clearance < 60ml/min
-Alcohol abuse (>4 units/day)
-AST or ALT elevation (>2.5x upper limit)
-Contraindication to MR scanning (i.e. pacemaker, metallic foreign body, claustrophobia)
