### Onderzoeksproduct en/of interventie

## Uitkomstmaten

### Primaire uitkomstmaten

The main objective of this pilot study is to investigate the effect of cognitive remediation training with CIRCuiTS on cognitive and daily functioning in a population of service users with severe mental illness that requires long-term intensive psychiatric treatment and support in a clinical setting. Also, the acceptability and feasibility of CIRCuiTS will be evaluated.

## Toelichting onderzoek

### Achtergrond van het onderzoek

Cognitive deficits are related to poor community functioning in people with severe mental illness who need long-term intensive psychiatric support. This pilot study is the first study to assess the combined effect of Computerised Interactive Remediation of Cognition - a Training for Schizophrenia (CIRCuiTS), and Transcranial Direct Current Stimulation (tDCS) on cognition and daily functioning. 26 service users, living in one of the residential treatment or sheltered living facilities of the cluster Active Recovery Triad (ART) of Lentis, will be randomly assigned to CIRCuiTS plus sham tDCS or CIRCuiTS plus active tDCS. We hypothesize that participants in both groups improve on cognitive functioning after the intervention period, and that participants who will receive CIRCuiTS in combination with active tDCS will improve more than the participants who receive CIRCuiTS + sham tDCS. Moreover, given the focus of CIRCuiTS on the practice in daily life, we hypothesize that participants will also improve in daily functioning.

The effects will be measured using a set of cognitive tests for verbal fluency, cognitive flexibility, memory, and attention (including the Controlled Oral Word Association Test, the Modified Card Sorting Test, the Digit Span Forward Test, the Digit Span Backward Test, the Rey Complex Figure Test and Recognition Trial, the Stroop Color Word Test, and the 15-word Learning Task). Subjective effects of the intervention will be evaluated with a short interview on feasibility, acceptability and effectiveness with the participant, and a questionnaire for subjective cognitive functioning (Cognitive Failure Questionnaire), and a questionnaire for negative symptoms (Self-evaluation of Negative Symptoms). Case managers complete the Nurses' Observation Scale of Cognitive Abilities and the Life Skills Profile for daily functioning.

### Doel van het onderzoek

We hypothesize that participants in both groups improve on cognitive functioning after the intervention period, and that participants who will receive CIRCuiTS in combination with active tDCS will improve more than the participants who receive CIRCuiTS + sham tDCS. Moreover, given the focus of CIRCuiTS on the practice in daily life, we hypothesize that participants will also improve in daily functioning.

## Onderzoeksopzet

September 2019 – February 2020: preparation phase.

March 2020 – February 2021: data gathering phase.

March 2021 – August 2021: evaluation phase.

## Onderzoeksproduct en/of interventie

Cognitive training with CIRCuITS, in combination with (active/placebo) tDCS

## Deelname eisen

### Belangrijkste voorwaarden om deel te mogen nemen (Inclusiecriteria)

Service users can be included if they meet the criteria for SMI (Delespaul et al., 2013):

- A psychiatric disorder that requires care/treatment (no remission of positive, negative and cognitive symptoms);
- Severe disabilities in social and/or societal functioning (no functional remission);
- Disabilities are the result of a psychiatric disorder
- Disabilities are structural (at least several years);
- Coordinated professional care is necessary to realize a treatment plan.

Each participant in the study should sign informed consent, and only those who are fully capable of making their own decision regarding participation in the study will be included.

Additional criteria for inclusion are an age of 18 years or older and sufficient mastery of Dutch language.

## Belangrijkste redenen om niet deel te kunnen nemen (Exclusiecriteria)

Service users will be excluded from tDCS if they have:

- Metal implants inside the skull or eye;
- Severe scalp skin lesions;
- A history of previous seizures.
- Alcohol or drug abuse;
- Pregnancy.

## Onderzoeksopzet

### Opzet

Type:	Interventie onderzoek
Onderzoeksmodel:	Parallel
Toewijzing:	Gerandomiseerd
Blinding:	Dubbelblind
Controle:	Placebo

### Deelname

Nederland	
Status:	Werving nog niet gestart
