Psychological well-being (anxiety, depression, psychological stress).

Toelichting onderzoek

Achtergrond van het onderzoek

This study investigates predictors of effects on psychological well-being and quality of life of a mindfulness based intervention in cardiac rehabilitation patients.

It is hypothesized that the mindfulness based intervention will be associated with a reduction in psychological symptoms and increase in quality of life. In addition, it is hypothesized that patients scoring high on psychological mindedness at baseline will show larger benefits compared to those low in psychological mindedness.

Doel van het onderzoek

It is hypothesized that the mindfulness based intervention will be associated with a reduction in psychological symptoms and increase in quality of life. In addition, it is hypothesized that patients scoring high on psychological mindedness at baseline will show larger benefits compared to those low in psychological mindedness. No effects of attention deficits or hyperactivity are anticipated.

Onderzoeksopzet

T1: Before intervention. All variables will be measured: anxiety and depression (Hospital Anxiety and Depression Scale), stress (Perceived Stress Scale), Quality of Life (QLMI), self-esteem (Rosenberg Self-Esteem Scale), psychological mindedness (BIPM), symptoms of ADHD.

Also at T2 (after the intervention) and T3 (one year after the intervention) all these questionnaires will be completed.

Onderzoeksproduct en/of interventie

Mindfulness-based stress reduction versus treatment as usual (TAU).

The applied mindfulness-based stress reduction is a group (6-8 patients) intervention, which

is loosely based on the Mindfulness-Based Stress Reduction (MBSR) program, as developed by Kabat-Zinn (1990). The adjusted program in this study is less intensive, including only three weekly 90 to 120 minutes meetings and an additional evaluation session two weeks later.

The treatment-as-usual (TAU) group consists of those cardiac rehabilitation patients who do not sign up for the intervention. They will be matched with the treatment group regarding age, sex, education, and level of baseline psychological well-being.

Deelname eisen

Belangrijkste voorwaarden om deel te mogen nemen (Inclusiecriteria)

1. Participants in cardiac rehabilitation of St. Catharina Hospital Eindhoven;

2. Age between 18-80 years.

Belangrijkste redenen om niet deel te kunnen nemen (Exclusiecriteria)

1. Severe psychiatric (e.g., suicidal ideation; psychotism) or somatic (e.g., heart failure; cancer) comorbidity;
2. Insufficient mastery of Dutch.
