Uitkomstmaten

Primaire uitkomstmaten

Primary outcomes include sexual functioning, sexual satisfaction, and quality of life.

Toelichting onderzoek

Doel van het onderzoek

The overall aim of this study is to study the effectiveness of a PLISSIT-model intervention in men and women with type 2 diabetes in primary care.

Primary outcomes include sexual functioning, sexual satisfaction, and quality of life. Secondary outcomes concern depressive symptoms, sexual distress, emotional well-being, and treatment satisfaction.

Onderzoeksopzet

All outcomes will be measured by means of self-report questionnaires at baseline, and after 3 and 12 months post-baseline. Treatment satisfaction will be assessed in telephone interviews.

Onderzoeksproduct en/of interventie

Patients in the intervention group will receive sexual counselling from their general practitioner based on the PLISSIT model. General practitioners in the intervention group will be trained by a sexologist to execute the PLISSIT model.

Patients in the control group will receive an information leaflet on Diabetes and Sexuality from their general practitioner, in addition to usual care.
