Verkorte titel

The BIND-study

Aandoening

drug-drug interaction
chronic renal failure
depression
neuropathic pain

Ondersteuning

Primaire sponsor: Deventer Ziekenhuis

Overige ondersteuning: Deventer Ziekenhuis, investigator initiated

Onderzoeksproduct en/of interventie

Uitkomstmaten

Primaire uitkomstmaten

To determine whether polystyrene sulfonate has an effect on exposure of amitriptyline, when taken simultaneously, compared to amitriptyline taken alone in healthy volunteers, expressed in Cmax and AUC0-8h.

Toelichting onderzoek

Achtergrond van het onderzoek

The resin polystyrene sulfonate is often used for binding potassium for prevention of hyperkalaemia. Because of their binding properties, resins could potentially bind other medications before they can be absorbed completely and thereby decrease their bioavailability. This is confirmed in in vitro binding interaction studies. Our own in vitro research has shown a binding interaction between polystyrene sulfonate and amitriptyline. More information is needed on this possible binding interaction to use amitriptyline and polystyrene sulfonate effectively and safely.

The objective is to determine the effect of the binding interaction, that was found in vitro, on drug exposure in healthy volunteers when amitriptyline and polystyrene sulfonate are used simultaneously.

The study design is a prospective, cross-over trial in healthy volunteers.

Main study parameter: Difference in exposure of amitriptyline in the presence and absence of polystyrene sulfonate, expressed in Cmax and AUC0-8h.

The participants will visit the hospital twice. Both times they will receive a single dose of amitriptyline and once they will receive polystyrene sulfonate concomitantly. Six blood samples will be collected, taken from a peripheral intravenous catheter, at each visit.

Doel van het onderzoek

Polystyrene sulfonate shows an in-vitro binding interaction with amitriptyline, causing 70-80% binding of amitriptyline to polystyrene sulfonate. The hypothesis is that polystyrene sulfonate binds to amitriptyline when taken simultaneously in healthy volunteers, leading to decreased exposure to amitriptyline.

Onderzoeksopzet

After intake of amitriptyline with/without polystyrene sulfonate

Onderzoeksproduct en/of interventie

Intake of amitriptyline alone and amitriptyline with polystyrene sulfonate

Deelname eisen

Belangrijkste voorwaarden om deel te mogen nemen (Inclusiecriteria)

- The participant is at least 18 years of age

Belangrijkste redenen om niet deel te kunnen nemen (Exclusiecriteria)

- Known allergy to one of the investigated substances
- Known renal or hepatic impairment
- Pregnancy
- Breast feeding
- Use of other medication within 24 hours of the study period (oral contraceptives within 12 hours of the study period)
- Contra-indication for one of the investigated substances (such as recent myocardial infarction, cardiac arrhythmias, hypokalaemia and obstructive bowel disease)
- History of a gastro-intestinal condition that may interfere with absorption of amitriptyline

Onderzoeksopzet

Opzet

Type:	Interventie onderzoek
Onderzoeksmodel:	Cross-over
Toewijzing:	Niet-gerandomiseerd
Blinding:	Open / niet geblindeerd
Controle:	N.v.t. / onbekend

Deelname

Nederland
