To evaluate the effectiveness of the ADAPT intervention on self-reported medication adherence

Toelichting onderzoek

Achtergrond van het onderzoek

Adherence rates among asthma patients are generally low and decrease during adolescence, resulting in poorly controlled asthma. The aim of this study was to evaluate the effectiveness of the ADolescent Adherence Patient Tool (ADAPT), an interactive mobile health (mHealth) intervention, in supporting self-management and improving inhaled corticosteroid adherence in adolescents with asthma.

We conducted a cluster randomized controlled trial in 66 Dutch community pharmacies. Asthma patients aged 12-18 years were invited to participate, based on medication refill records. The main study outcome was self-reported medication adherence, measured with the Medication Adherence Report Scale (MARS). Secondary outcomes were asthma, control quality of life, illness perceptions, and medication belief. Outcomes were measured at start (t=0 months) and at the end of follow-up (t=6 months). Mixed-effects models were used to analyze the effect.

In total, 234 adolescents (147 in the control group and 87 in the intervention group) completed the study; mean age 15.1±1.9 years and 52.6% females. Adherence rates of patients with low baseline adherence (MARS scores \leq 19; n=76) increased with 1.42 points in the intervention group (n=26). Adherence rates of patients in the control group (n=50) decreased with 0.70 points. Thus there was a positive effect of the intervention on medication adherence (MARS +2.12, p=0.04). This effect was stronger (MARS +2.52, p=0.02) in poor adherent adolescents with uncontrolled asthma (n=74). No effect of the intervention, and medication beliefs.

Most patients (78%) would recommend the ADAPT intervention to others, and thought that the pharmacy was the right place for mHealth aiming to support adherence (63%). The possibility to monitor asthma symptoms was highly appreciated by patients and pharmacists. Pharmacists were satisfied with ADAPT intervention (96%), and using the intervention was not time consuming (91%). The ADAPT intervention promoted contact with patients (74%) and facilitated the healthcare providing role of pharmacists (83%).

The ADAPT intervention increases adherence in adolescents with asthma having with poor adherence rates. Both pharmacists and patients were positive about the ADAPT intervention.

Healthcare providers could consider a tailored mHealth approach to improve the asthma treatment. This study emphasizes opportunities for mHealth in improving the quality of care, which supports the need for further implementation in clinical practice.

Doel van het onderzoek

A mHealth intervention will be effective in improving adherence and asthma outcomes in adolescents with asthma

Onderzoeksopzet

Patients in the intervention group use the smartphone application and will be followed by their pharmacist through a management system for 6 months. To determine the effect of the ADAPT intervention a questionnaire is used to measure the primary and secondary parameters at baseline (t=0) and after 6 months at the end of the follow-up (t=6).

Onderzoeksproduct en/of interventie

The ADAPT (ADolescent Adherence Patient Tool) intervention consisted of a smartphone application for patients, which was securely connected to a desktop application of community pharmacists.

3 - Development and testing of an adolescent adherence patient tool for asthma. 16-05-2025

Deelname eisen

Belangrijkste voorwaarden om deel te mogen nemen (Inclusiecriteria)

Adolescent patients using inhaled corticosteroids (ICS) registered in one of the pharmacies in the UPPER-network

- Age between 12-18 years

- Use of ICS: filling of at least 2 prescriptions for ICS or ICS/LABA combination during the previous 12 months

- Diagnosis of (persistent) asthma (verified by GP)
- Having a smartphone

Belangrijkste redenen om niet deel te kunnen nemen (Exclusiecriteria)

- Patients who use ICS for indications other than asthma
- Patients who have insufficient understanding of the Dutch language
- Patients who are not able to take care for themselves (e.g. living in an institution)
