

# Pilot study into the working mechanism of a brace preventing hip displacement after total hip replacement surgery

Gepubliceerd: 15-10-2017 Laatst bijgewerkt: 15-05-2024

The brace is able to restrict the movement that pose a risk for hip displacement after total hip replacement surgery

<b>Onderzoekstype</b>	Interventie onderzoek

## Samenvatting

### ID

NL-OMON29467

### Bron

Nationaal Trial Register

### Aandoening

Healthy volunteers

Hip replacement surgery

Gezonde vrijwilligers

Operatie waarbij een nieuwe heup wordt geplaatst

### Ondersteuning

**Primaire sponsor:** Roessingh Research and Development

**Overige ondersteuning:** Non-funded research

### Onderzoeksproduct en/of interventie

### Uitkomstmaten

#### Primaire uitkomstmaten

Peak hip anteflexion, adduction, endorotation and exorotation during several functional

activities.

## Toelichting onderzoek

### Achtergrond van het onderzoek

Preventing hip dislocation is an important part of the postoperative care after total hip replacement. Hip dislocation is associated with implant failure and it may lead to recurrent hip dislocations. One of the possible interventions to prevent hip dislocation is the prescription of a brace, such as the Rebound Hip brace, that restricts the movements that are associated with hip dislocations. While these braces are prescribed in daily care there is little scientific knowledge about the efficacy of these braces in preventing movements that might lead to a hip displacement.

In this trial we exam whether a brace preventing hip displacement restricts the movements that pose a risk for hip displacement in a group of healthy adults.

The subjects will perform a set of measurements consisting of different activities of daily living both with and without the brace. After completion of the measurements, the brace will be removed and subjects will leave the study.

The main study parameters are the peak hip flexion, adduction and rotation angles during the execution of the different tasks. In addition, we will study the peak angles of the other joints to see whether the brace influences the movements of these joints.

### Doel van het onderzoek

The brace is able to restrict the movement that pose a risk for hip displacement after total hip replacement surgery

### Onderzoeksopzet

Single measurement

### Onderzoeksproduct en/of interventie

Prescription of a brace that prevents hip displacement after total hip replacement surgery.

# Deelname eisen

## Belangrijkste voorwaarden om deel te mogen nemen (Inclusiecriteria)

- Aged 18 and above.
- No musculoskeletal problems influencing walking ability and range of motion of the hip. To objectify the musculoskeletal problems, the primary investigator will go through a questionnaire ('Vragenlijst Orthopedische Problemen' ) together with the participant. In addition, the primary investigator who has a background in physical therapy will assess the hip range of motion to see whether participants are able to make the movements that pose a risk for hip dislocation (>90 hip flexion, adduction and rotations).
- Be able to be physically (low-intensity) active for a period of 4 hours.

## Belangrijkste redenen om niet deel te kunnen nemen (Exclusiecriteria)

- Had a joint replacement surgery of one of the joints of the lower extremities.
- Not able to understand Dutch or English instructions.

## Onderzoeksopzet

### Opzet

Type:	Interventie onderzoek
Onderzoeksmodel:	Anders
Toewijzing:	N.v.t. / één studie arm
Blinding:	Open / niet geblindeerd
Controle:	N.v.t. / onbekend

### Deelname
